

Protect Your Home Against A Leaking Water Heater or Dripping Well-Water Tank!

FloodRing[®]

Water Tank Protection System

How can you tell when your hot water tank is about to die? You don't usually get any warning at all! The average life of a water heater is 7 years and when it fails a pressurized, unlimited amount of water floods your basement. Cold water storage tanks continuously drip onto your floor in the summer from unending condensation. Now there is a solution. FloodRing!

FloodRing™ around a water heater protects your basement from leaks and flooding.

FloodRing™ surrounding water tank is designed to work with our patented WaterGuard® or DryTrak® Systems.

FloodRing™ around a water heater, showing optional WaterWatch® Alarm.

The **FloodRing**[®] by Basement Systems Inc. was designed in a unique semi-circle shape so it can be installed without disturbing the water heater or well tank. Two sections of the **FloodRing**[®] System are joined and adhered to the floor creating a watertight seal. The **FloodRing**[®] System drains into the patented **WaterGuard**[®], **DryTrak**[®]

or **SuperSump**[®] basement waterproofing systems. When the water heater leaks, the **FloodRing**[®] contains the flooding and drains the water away through our waterproofing system into our **SuperSump**[®], where it will be removed.

Now, you can rest easy knowing you are protected!

*FloodRing[®] is a patented product & a registered trademark of Basement Systems Inc!
